

KW907-BT

SONAR BEACON TESTER

The KW907-BT is a low cost, hand held Sonar Beacon Tester which is used to test the operation of the Underwater Locator Beacon installed on all fixed Protective Data Capsules of the VDR and S-VDR systems.

The major advantages of this unit are:- lightweight, low cost and its auto-sensing functionality. Therefore manual tuning to each different manufacturer's beacon frequency is not required as the KW907-BT will automatically tune to the relevant frequency.

Engineers carrying out VDR and S-VDR annual surveys as well as Superintendents and Electro -Technical Officers carrying out routine checks need to test the Beacon located on the fixed data capsule. The KW907-BT provides the most cost effective and reliable solution available.

The AMI KW907-BT is designed and priced with the engineer in mind!!

Technical Specification:

- Single handed operation
- Performs required operational tests for all beacons in the 30 - 45 KHz Range
- Used without removing the beacon from the capsule
- Compatible with all major manufacturers including L3, Consillium, Kelvin Hughes, Furuno etc.
- Audible Test Result
- "Power On" Indication
- Compact unit - dimensions - 144 x 60 x 27 mm

The unit requires 1x 9v PP3 battery (not supplied)
